

# Networking resources in Lightsail

---

## Note

Lightsail has several networking resources to choose from: DNS zones, load balancers, and static IP addresses. These resources improve how users and outside services connect to your Lightsail instances. DNS helps make your web application easier to find, static IP addresses let you keep the same IP address every time you reboot your instance, and load balancers add redundancy and help you handle more web traffic.

*Last updated: November 29, 2017*

## DNS zones

You can create *DNS zones* to make it easier to find your web application.

[Learn more about DNS zones](#)

## Lightsail load balancers

You can create *load balancers* to add redundancy or to handle more traffic.
